BUILT BY A TEAM THAT HAS SECURED MAJOR FINANCIAL INSTITUTIONS WORLDWIDE FOR 25 YEARS.

ARGENT AIR-GAPPED ON-PREM

YOUR SERVERS, YOUR SEALED NETWORK. ALL OF ARGENT INSIDE.

Argent Strategic Intelligence sits between your AI agents and the models they use. The air-gapped install puts all of it on your own servers: the gateway, the console, the signed records, the sensitive-data detector and the data tier. The AI model can run there too. In an air gap, data crosses only by hand.[1]

The release is carried in, not downloaded. One signed bundle on removable media holds every image. Your team checks it and loads your own registry, then installs on a Kubernetes cluster or a single Linux server. Updates arrive the same way.

SEE.
Every agent request on your sealed network.

PROVE.
Signed records kept on your own storage.

STOP.
Sensitive data is stopped before the model.

WHAT AN ON-PREMISES INSTALL GIVES YOU

1	**Everything inside** Security asks what has to live outside.	The self-hosted profile runs the whole data tier in your cluster: the database, the cache, the secrets store and an object-locked evidence store. The gateway, console and sensitive-data detector run beside them, on your servers.
2	**Two ways to install** A pilot on one server, then a cluster.	One Helm chart for Kubernetes 1.34 or newer, with a profile for self-hosted clusters such as k3s and RKE2. Or a single-server bundle for one Linux host, with a host check and per-install secrets generated on the box and never printed.
3	**Checked on arrival** The release comes in on removable media.	The import checks the release signature, the checksum list, every file and each image's digest, stops on any mismatch, and loads your own registry. One setting then points the install at that registry.
4	**Local AI models** Engineers run Ollama on internal servers.	Routes can point at self-hosted engines such as Ollama, LM Studio and vLLM, each turned on by an admin. Argent needs no AI model of its own to do its job; the few features that use one are optional.
5	**Outbound by choice** Security asks: does it phone home?	Argent's own services open no outside connection by default. The price feed is off until an operator turns it on, the console loads nothing from outside, and connectors exist only when an admin adds them.

WHAT THE SECURITY STANDARDS SAY

NIST glossary (CNSSI 4009). An air gap is an interface where two systems are not connected physically and data moves "only manually, under human control."[1]

NIST SP 800-53, SC-7(5). For moderate- and high-impact US federal systems: deny network traffic by default and allow it by exception. Argent's own services open no outbound connection by default.[2]

HOW A TEAM STARTS

1. Carry in. Bring the signed bundle across on media. The import checks every file and image, then loads your registry.

2. Install. Point the Helm chart or the single-server bundle at your registry. Secrets stay inside: in-cluster OpenBao, or made on the box for one server.

3. Route and watch. Point agents at the gateway and routes at local models. Start in watch mode, then enforce.

BOOK A DEMO. SEE ARGENT INSTALLED ON SERVERS WITH NO INTERNET.
